

This is a view of the property from the side where the green house is located. As you can see the property go down a slope. We are interested in design for both levels with the top level being the priority.

This is a view of the first level of the property. We envision the following element being incorporated into the design: Outdoor Classroom (pavilion), terraced row garden to account for the slope in landscape, center focal point with plants for your pollinators, butterfly garden, raised beds and elevated raised beds and drip irrigation system.

This is a view of the property showing the road that divides the upper and lower level. We want to plant fruit in the bottom level of the garden (Aggregate Fruits (Blueberry, Raspberry, Blackberry, Strawberry) or Stone Fruits (Peaches or Plums))

This is a view of the property that shows the slope going up towards the greenhouse and ag class.

This is another angle of the road that divides the top level and bottom level of the garden.

This is a view of the bottom level of the property where we envision the fruit being planted.
